

Customized solutions for special requirements

Customized solutions for special requirements

Although the articulation systems presented here cover more than 90% of customer requirements, there remains a need for individual solutions. HÜBNER has been developing customized articulation systems in accordance with individual customer needs for many years and can certainly help you with any non-standard requirements you might have.

Our foremost criterion: Quality

Fully protocolled functional testing takes place after the assembly of each articulation system. A 100% functional examination is conducted at a test station that analyzes all the relevant components of each system.

The use of maintenance-free damping cylinders in HÜBNER articulation systems allows for a long service interval. Our damping systems are available in standard and deluxe versions. In development, manufacturing and service, quality always comes first.

Platform

The platform provides passengers with a comfortable means of passing from one vehicle segment to the next. It reliably absorbs all motions generated during vehicle operation. A variety of convenient models are available for differing maintenance demands.
