

Universal articulation

HNGK 19.5 - The universal articulation system

The universal articulation system is the most frequently used system worldwide. Its advantages lie in the simple and clearly defined connection surfaces allowing for problem-free fitting to the front and rear vehicle segments.

Today it is available in a standard and a deluxe version, both of which are nearly maintenance free. The main components of the system such as the bearing, the system control and the damping elements are all easily accessible. In the event of damage, single dampers can be replaced individually. Usually the universal system is delivered with an electronic control system that detects the driving situation, controls the driving performance and also conducts a system diagnosis for early detection of any defects.

Universal articulation HNGK 19.5

System weight: 700 kg

Suitable for low-floor and high-floor buses

Clearly defined connection surfaces

High damping moment

Robust construction

Elastic torsional connection

Integrated power supply

Available in standard or deluxe version
