

Power connection: C-shape for the roof

C-shaped energy guiding

In low-floor buses, the possibilities for installing power connection systems beneath the articulation are very limited due to the overall height. Therefore, the power connection is mostly routed either through the roof or fitted into the side sections of the bus.

The C-shaped power connection system is suitable to be installed in the roof. By using the C-shape, all motions are avoided which frequently lead to buckling and bending of the hoses.

Separation plates on the front and rear car provide precise interfaces to the vehicle sections.
