

Multi-component injection molding

More components - more possibilities

We make high-grade plastic parts by multi-component injection molding (2 K, 3 K). Without supplementary assembly we incorporate additional functions. Thus, we guarantee high process stability and low production costs.

The combination of these materials yields a number of new possibilities for construction of components which before had to be made from single parts.

Your advantage: only one molding cycle, no assembly, high process stability and low production costs.
