

Articulation systems

Articulation systems for any and all demands

HÜBNER GmbH offers a comprehensive range of articulation systems for all requirements in the low and high floor segments. Our many years of experience and our stringent quality standards form a solid basis for innovative product development, reliable manufacturing and customer-friendly service. We use only materials of the highest quality to ensure that we can provide the many diverse features simultaneously required of modern-day products, e.g. low weight, high load factors and temperature resistance. Our articulation systems are modularly structured so that we can supply individual solutions to meet the demands of all our customers.

Our articulation systems are designed on the basis of FEM (Finite Element Method) calculations. Data from tests carried out under extreme conditions throughout the world underpin these calculations.

Subsequently, all HÜBNER articulation systems are subjected to demanding endurance tests at well-known laboratory and university testing facilities.
